

The Development Application Base of Engineering Talents (iDABET)
Project of the Industrial Development Administration, Ministry of Economic Affairs
**2025 Practical Ability Development Implementation Unit Project –
Engineering Talent Practical Ability Development Record Form**

Project No. of the Practical Ability Development Implementation Unit: DABET11403

No. of Engineering Talent: 40

Name of the Practical Ability Development Implementation Unit: 財團法人金屬工業研究發展中心/光電技術組

Project Name of the Practical Ability Development Implementation Unit: 半導體產業之真空設備與製程能力發展與人工智慧控制應用

Name of the Engineering Talent: 蘇翼

Item	Date	Instructor	No. of Hours (Note 1)	Type of Practical Ability Development Topic (Note 2)	Topic	Description
1	6/2	李宗信	2	1	Project Briefing	Discussing the progress of our project and areas of improvement.
2	6/3	李宗信	7	1	Indoor Positioning System Research (Thesis)	Independent Study: Setting up the perimeter to calculate the error of the system.
3	6/5	吳以德	2	2	iDABET Cake Resume Workshop	Interview skill building and enhancing resume for opportunities in Taiwan
4	6/6	李宗信	4	1	Indoor Positioning System Research (Thesis)	Independent Study: Testing the perimeter to calculate the error of the system.
5	6/9	李宗信	4	1	Indoor Positioning System Research (Thesis)	Independent Study: Getting data for deducing the error.
6	6/12	陳泰宏	4	2	日久電子參訪活動	Learning about DC motors
7	6/13	李宗信	3	1	Indoor Positioning System Research (Thesis)	Independent Study: Project briefing.
8	6/14	李宗信	8	1	Indoor Positioning System Research (Thesis)	Independent Study: Setting up a linear path to check for error more precisely.
9	6/16	李宗信	8	1	Indoor Positioning System Research (Thesis)	Independent Study: Testing the linear path and checking the error.

10	6/18	李宗信	8	1	Indoor Positioning System Research (Thesis)	Independent Study: Testing the linear path and checking the error (continued).
11	6/19	李宗信	4	1	Indoor Positioning System Research (Thesis)	Independent Study: Comparing experimental results with theoretical ones.
12	6/20	李宗信	4	1	Indoor Positioning System Research (Thesis)	Independent Study: Briefing
13	6/23	李宗信	6	1	Indoor Positioning System Research (Thesis)	Independent Study: Debugging customized tracking code.
14	6/24	李宗信	2	1	Indoor Positioning System Research (Thesis)	Independent Study: Debugging customized tracking code (continued).
15	6/25	李宗信	8	1	Indoor Positioning System Research (Thesis)	Independent Study: Debugging customized tracking code (continued).
18	6/26	陳泰宏	2	2	Semiconductor Processes	Thermal baking, Vacuum and Exposure System
19	6/26	陳泰宏	2	2	Semiconductor Processes	Thermal baking, Vacuum and Exposure System
20	6/27	李宗信	4	1	Indoor Positioning System Research (Thesis)	Independent Study: Briefing
Total Hours on Practical Ability Development Topics			Total ____ 82 ____ hours.			

Please add rows to the table as needed.

- Notes: (1) The hours for implementing practical ability development topics should be filled in according to the actual implementation status between March 1 and August 31.
- (2) Type of practical ability development topics: 1. Practice-based; 2. Industry collaboration-based.
- (3) Please attach at least 6 dated photos (yyyy/mm/dd) as evidence of the engineering talent's participation in practical ability development topics or activities.
- (4) Both the instructor and engineering talent shall sign at the bottom of the record form.
- (5) To implement the “2025 Development Application Base of Engineering Talents (iDABET) Project”, the Industrial Development Administration, Ministry of Economic Affairs will collect, process and use the personal data of the party involved without notifying the said party, as prescribed in Subparagraph 2 of Paragraph 2 of Article 8 of the Personal Data Protection Act.

【Photos of Participation in Practical Ability Development Topics or Activities】

Mid-Term Project Briefing

We reviewed the overall progress of the event and reflected on how it has significantly deepened our understanding of the semiconductor industry. From technical lectures to practical, hands-on sessions, each activity provided valuable insight into real-world applications of semiconductor processes. I'm truly grateful for the opportunity to participate in this program. It has not only enhanced my technical skills but also broadened my perspective on potential career paths in the field.

工程人才 融能強化活動

This professional development event, held in Hsinchu, focused on live streaming strategies and leadership development for engineering professionals. During the session, we were divided into groups and asked to select a team leader. Our task was to build a tower using only newspaper and chopsticks. Through this hands-on activity, I realized the critical role that effective communication and teamwork play in achieving group goals. Without clear communication and collaboration, progress becomes slow or even impossible.

日久電子參訪活動

We visited Eternity Electronics Industrial Company (日久電子), where we learned about the components of a DC motor. After a brief introduction, we were given the individual parts and tasked with assembling and testing the motor ourselves. This was a highly engaging and insightful activity, especially for me, as I thoroughly enjoy hands-on projects like this.

Project briefing

During my recent thesis presentation, I shared the progress and current findings of my research. I outlined the key results I have obtained so far and discussed several areas where I encountered challenges—particularly with data consistency and system optimization. My professor 王聖禾, along with Mr. 李宗信, provided valuable feedback and suggestions on how to improve my results. Their insights focused on refining my methodology and exploring alternative approaches to strengthen the accuracy and reliability of my outcomes.

Cleanroom Thermal Treatment

In this session, we tested the thermal baking system used in semiconductor processing. The system plays a crucial role in ensuring uniform heating during the wafer fabrication process. In the image, you can see five thermal sensors (nodes) strategically placed on the heating bed. These nodes are used to monitor and verify temperature distribution across the surface, helping to identify any inconsistencies that could affect process reliability and product quality. Accurate thermal control is essential for achieving optimal material properties and precise layer formation in semiconductor devices.

Cleanroom Exposure Treatment

In this session, we tested the photolithography exposure system, which is another critical step in the semiconductor manufacturing process. In the photo, I am carefully placing the sample wafer onto the chuck, ensuring proper alignment and vacuum sealing for stability. Once secured, I proceeded with the remaining steps of the exposure process, including aligning the photomask, adjusting the focus, and initiating UV light exposure. This step is essential for accurately transferring the desired circuit pattern onto the photoresist-coated wafer, playing a key role in defining the microstructures of the semiconductor device.

Notes:

1. Please add rows to the table as needed. Each photo shall be dated at the bottom right, and each photo shall be accompanied by descriptions below it to explain the topic.
2. Please provide the original files of 1 to 3 photos (JPEG files, each above 1MB in size and with a resolution above 300 DPI).
